

## Log house 3.7

<b>Net; m<sup>2</sup></b>	<b>67,49</b>	Dwelling-space of the building. Partially it also includes other useful elements of the building, i.e. terraces, the attic.
1st Floor	61,49	Floor area inside the building.
Terraces	2,61	Roof construction covers and shelters about 2/3 of the terrace area, thus the useful area is reduced by 1/3.
Attic	3,39	Due to the particularly low ceiling only 1/5 can be counted.
Gross; m <sup>2</sup>	77,50	Building or foundation site covered by the 1st floor and terrace constructions.

<b>Logs; m<sup>2</sup></b>	<b>196,85</b>	Area of logs (except apertures) precisely reflects material input of the building and forms the price of the project.
<b>Coefficient</b>	<b>2,92</b>	Proportion between the Logs and Net m <sup>2</sup> . The lower the coefficient, the lower the price for a square meter of the dwelling-space.

If you wish to order this very project, we will contact the author to receive permission.

Eko Nams Ltd only carried out development of the production or technical © project.  
The three-dimensional views reflect architectural and constructive solutions for log buildings.  
Project statistics helps to evaluate this project, taking into account the area of Logs in m<sup>2</sup>.
